1. **Ans. (A)**

By the rule of round off

$$4.74 \times 10^{-6} \text{ kg}$$

2. **Ans. (A)**

First solve division, then multiply and then add.

$$\frac{3.88}{3.0} = 1.3$$

$$1.3 \times 4.835 = 6.3$$

$$6.3 + 4.338 = 10.6$$

3. **Ans. (B)**

Volume $V = l \times b \times t$

$$= 12 \times 6 \times 2.45 = 176.4 \text{ cm}^3$$

$$V = 1.764 \times 10^2 \text{ cm}^3$$

Since, the minimum number of significant figures is one in breadth, hence volume will also contain only one significant figure. Hence, $V = 2 \times 10^2 \text{ cm}^3$.

4. **Ans. (B)**

$$1\text{MSD} = \left(\frac{1}{2}\right)^\circ = 30'$$

$$\Rightarrow 30\text{VSD} = 29\text{MSD}$$

$$\Rightarrow 1\text{VSD} = \frac{29}{30}\text{MSD}$$

$$L.C. = 1\text{MSD} - 1\text{VSD}$$

$$L.C. = 1\text{MSD} - \frac{29}{30}\text{MSD}$$

$$\Rightarrow L.C. = \frac{1}{30}\text{MSD} = \frac{30'}{30} = 1'$$

5. **Ans. (B)**

Scale has positive error.

$$8 \times 0.5\text{mm} + \frac{81}{100} \times 0.5$$

$$= 4.405\text{mm}$$

6. **Ans. (C)**

$$\text{Last count (LC)} = \frac{\text{Pitch}}{\text{No. of division on circular scale}}$$

$$\Rightarrow LC = \frac{0.5}{50} = 0.01\text{mm}$$

$$\text{Zero error} = +5 \times LC = 5 \times 0.01 \text{ mm}$$

$$VSR = 25 \times LC = 25 \times 0.01 \text{ mm}$$

$$MSR = 2 \times 0.5 \text{ mm} = 1 \text{ mm}$$

$$\text{Reading} = MSR + VSR - \text{Zero Error}$$

$$= 1 \text{ mm} + 25 \times 0.01 \text{ mm} - 5 \times 0.01 \text{ mm}$$

$$= 1 \text{ mm} + 20 \times 0.01 \text{ mm}$$

$$= 1 \text{ mm} + 0.20 \text{ mm}$$

$$= 1.20 \text{ mm}$$

7. **Ans. (C)**

$$\text{Least count} = \frac{0.5}{50} = 0.01 \text{ mm}$$

$$\text{Diameter of ball } D = 2.5 \text{ mm} + (20)(0.01)$$

$$D = 2.7 \text{ mm}$$

$$\rho = \frac{M}{\text{vol}} = \frac{M}{\frac{4}{3}\pi\left(\frac{D}{2}\right)^3}$$

$$\left(\frac{\Delta\rho}{\rho}\right)_{\max} = \frac{\Delta m}{m} + 3\frac{\Delta D}{D}$$

$$\left(\frac{\Delta\rho}{\rho}\right)_{\max} = 2\% + 3\left(\frac{0.01}{2.7}\right) \times 100\%$$

$$\frac{\Delta\rho}{\rho} = 3.1\%$$

8. **Ans. (D)**

$$\frac{\Delta x}{x} = 1\% = 10^{-2}$$

$$\frac{\Delta y}{y} = 3\% = 3 \times 10^{-2}$$

$$\frac{\Delta z}{z} = 2\% = 2 \times 10^{-2}$$

$$t = \frac{xy^2}{z^3}$$

$$\frac{\Delta t}{t} = \frac{\Delta x}{x} + \frac{2\Delta y}{y} + \frac{3\Delta z}{z}$$

$$= 10^{-2} + 2 \times 3 \times 10^{-2} + 3 \times 2 \times 10^{-2}$$

$$= 13 \times 10^{-2}$$

$$\% \text{ error in } t = \frac{\Delta t}{t} \times 100 = 13\%$$

9. **Ans. (D)**

$$\frac{1}{R_{eq}} = \frac{1}{R_1} + \frac{1}{R_2}$$

$$R_{eq} = \frac{3 \times 6}{3+6} = 2\Omega$$

$$\frac{\Delta R_{eq}}{R_{eq}} = \frac{\Delta R_1}{R_1} + \frac{\Delta R_2}{R_2}$$

$$\therefore \frac{\Delta R_1}{R_1} \times 100 = 1 \Rightarrow \frac{\Delta R_1}{R_1} = 1 \times 10^{-2}$$

$$\therefore \frac{\Delta R_2}{R_2} \times 100 = 2 \Rightarrow \frac{\Delta R_2}{R_2} = 2 \times 10^{-2}$$

$$\frac{\Delta R_{eq}}{R_{eq}} = \left[\frac{1 \times 10^{-2}}{3} + \frac{2 \times 10^{-2}}{6} \right] \times 2 = \left[\frac{4 \times 10^{-2} \times 2}{6} \right] = \frac{4}{3} \times 10^{-2}$$

$$\therefore \% \text{ error} = \frac{4}{3} \%$$

10. **Ans. (A)**

Most of the sound emitted by a tuning fork is propagated in the plain in which the prongs lie. Here the sound has to be directed into the tube.

11. **Ans. (B)**

$$\frac{V}{4(\ell + e)} = f$$

$$\Rightarrow \ell + e = \frac{V}{4f}$$

$$\Rightarrow \ell = \frac{V}{4f} - e$$

$$\text{Here } e = (0.6) r = (0.6) (2) = 1.2 \text{ cm}$$

$$\text{So } \ell = \frac{336 \times 10^2}{4 \times 512} - 1.2 = 15.2 \text{ cm}$$

12. **Ans. (C)**

$$\text{Real depth} = x_3 - x_1 = 13.895 - 12.324 = 1.571 \text{ cm}$$

$$\begin{aligned} \text{Apparent depth} &= x_3 - x_2 = 13.895 - 12.802 \\ &= 1.093 \text{ cm} \end{aligned}$$

$$\text{Refractive index} = \frac{1.571}{1.093} = 1.437$$

13. **Ans. (D)**

$$\frac{1}{v} - \frac{1}{u} = \frac{1}{f}$$

$$\therefore \frac{1}{f} \text{ is intercept}$$

$$\therefore \frac{1}{f} = 0.2 \text{ cm}^{-1}$$

$$\Rightarrow P = 0.2 \times \frac{100}{m}$$

$$\Rightarrow P = 20D$$

14. **Ans. (D)**

$$V = u \text{ and } \frac{1}{V} + \frac{1}{u} = \frac{1}{f}$$

$$\frac{2}{V} = \frac{1}{f}$$

$$\Rightarrow V = 2f, u = 2f$$

15. **Ans. (A)**

Experimental.

16. **Ans. (B)**

$$\frac{mg}{\pi r^2} = (Y) \frac{x}{\ell_0}$$

$$Y = \frac{mg\ell_0}{\left(\pi \frac{d^2}{4}\right)x} = 2 \times 10^{11} \text{ N/m}^2$$

$$\left(\frac{\Delta Y}{Y}\right) \left(\frac{\Delta d}{d}\right) \frac{\Delta x}{x}_{\max}$$

$$= 2 \left(\frac{0.01}{0.4}\right) + \frac{0.05}{0.8} = \frac{9}{80}$$

$$\Delta Y = \frac{9}{80} \times 2 \times 10^{11} = 0.225 \times 10^{11} \text{ N/m}^2$$

$$= 0.2 \times 10^{11} \text{ N/m}^2$$

17. **Ans. (C)**

$$\frac{100}{40} = \frac{R}{60} \Rightarrow R \Rightarrow 150\Omega$$

$$\frac{\Delta R}{R} \Rightarrow \frac{\Delta \ell_1}{\ell_1} + \frac{\Delta \ell_2}{\ell_2} \Rightarrow \frac{1}{400} + \frac{1}{600}$$

$$\Delta R \Rightarrow 0.625\Omega$$

18. **Ans. (B)**

According to Pauli's exclusion principle, the electronic configuration of number of subshells existing in a shell and number of electrons entering each subshell is found. Hence, on the basis of Pauli's exclusion principle, the manifestation of bond structure in solids can be explained.

19. **Ans. (C)**

After joining p -type and n -type semiconductors, electrons from the n -region near the p - n interface, tend to diffuse into the p -region. As electrons diffuse, they leave positively charged ions (donors) in the n type region. Likewise, holes from the p -type region near the p - n interface begin to diffuse into the n -type region, leaving fixed ions (acceptors) with negative charge.

Thus, an electric field is established at the junction directed from the n -type side to the p -type side.

20. **Ans. (A)**

$$\text{Given, } \frac{n_e}{n_n} = \frac{7}{5}, \frac{I_e}{I_n} = \frac{7}{4}$$

$$\text{As we know, } I = neAV_d$$

$$\frac{I_e}{I_n} = \frac{n_e \times (V_d)_e \times A_e}{n_n \times (V_d)_n \times A_n}$$

$$\frac{7}{4} = \frac{7}{5} \times \frac{(V_d)_e}{(V_d)_n}$$

$$\frac{(V_d)_e}{(V_d)_n} = \frac{5}{7} \times \frac{7}{4} = \frac{5}{4}$$

21. **Ans. (B)**

Conceptual

22. **Ans. (B)**

$$\frac{d^2V}{dx^2} = -\frac{\rho}{\epsilon_0} \Rightarrow \frac{dE}{dx} = \frac{\rho}{\epsilon_0} \propto x \Rightarrow E \propto x^2$$

23. **Ans. (C)**

(i) $V_A = -10V$ and $V_B = -5V$

D_1 and D_3 reverse biased, D_2 is forward biased

$$\Rightarrow R_{AB} = R + \frac{R}{4} + \frac{R}{4} = \frac{3}{2}R$$

(ii) When $V_A = -5V$ and $V_B = -10V$

D_2 is reverse biased, D_1 and D_3 are forwards biased,

$$\Rightarrow R_{AB} = \frac{R}{4} + \frac{R}{2} + \frac{R}{4} = R$$

(iii) In this case equivalent resistance between A and B is also R .

24. **Ans. (D)**

D_1 is reverse biased therefore it will act like an open circuit

$$i = \frac{12}{6} = 2.00 A$$

25. **Ans. (B)**

As Zener diode is being used as voltage regulator, voltage across R_L has to be constant so current I_L has to be constant, as voltage V_{in} is increasing voltage drop at R_s will increase so current through R_s increases.

Since $I = I_Z + I_L$

I_L is constant and $I \uparrow$ so $I_Z \uparrow$.

26. **Ans. (D)**

When the voltage is $-5V$, the diode will be reverse biased and the voltage drop across the resistor will be zero as there is no current in the circuit.

And when voltage is $+5V$, the diode will be forward biased, the voltage drop across resistor will be the same as input voltage.

27. **Ans. (C)**

Initially Ge and Si are both forward biased so current will effectively pass through Ge diode with a drop of $0.3 V$.

So, $V_0 = 12 - 0.3 = 11.7 V$

if " Ge " is reversed then current will flow through " Si " diode is

$$V_0 = 12 - 0.7 = 11.3 V$$

So difference = $11.7 - 11.3 = 0.4V$

28. **Ans. (B)**

Maximum current will flow from Zener if input voltage is maximum.

When Zener diode works in breakdown state, voltage across the Zener will remain same.

$$\therefore V_{\text{across } 4k\Omega} = 6V$$

$$\therefore \text{Current through } 4k\Omega = \frac{6}{4000} A = \frac{6}{4} mA$$

Since input voltage = 16V

$$\therefore \text{Potential difference across } 2k\Omega = 10V$$

$$\therefore \text{Current through } 2k\Omega = \frac{10}{2000} = 5mA$$

$$\therefore \text{Current through Zener diode} \\ = (I_S - I_L) = 3.5 mA$$

29. **Ans. (B)**

As there are two zener diodes in reverse polarity so if one is in forward bias the other will be in reverse bias and above 6V the reverse bias will too be in conduction mode. Therefore when voltage is more than 6V the output will be constant and when it is less than 6V it will follow the input voltage so correct answer is two.

30. **Ans. (B)**

Zener diode is heavily doped and have narrow depletion layer.

Option (B) is correct.

31. **Ans. (B)**

For $A = 0, B = 0$

Similarly check for other option in the table.

32. **Ans. (D)**

The output D for the given combination –

$$D = \overline{(A + B)} \cdot C = \overline{(A + B)} + \overline{C}$$

$$\text{If } A = B = C = 0 \text{ then } D = \overline{(0 + 0)} + \overline{0} = \overline{0} + \overline{0} = 1 + 1 = 1$$

$$\text{If } A = B = 1, C = 0 \text{ then } D = \overline{(1 + 1)} + \overline{0} = \overline{1} + \overline{0} = 0 + 1 = 1$$

33. **Ans. (C)**

If either/both input are high $\Rightarrow$ output high

If both are low $\Rightarrow$ output low

Hence OR Gate.

34. **Ans. (D)**

$$P = \bar{x} + y$$

$$Q = \overline{\bar{y} \cdot x} = y + \bar{x}$$

$$O/P = \overline{P + Q}$$

To make O/P

$$P + Q \text{ must be '0'}$$

$$\text{So, } y = 0$$

$$x = 1$$

$$L \cdot C = 1 \text{ mm} - 0.9 \text{ mm} = 0.1 \text{ mm}$$

$$S \cdot G \rightarrow L \cdot C = \text{Pitch/no. of turn}$$

$$L \cdot C = 1 \text{ mm} / 100 = 0.01 \text{ mm}$$

$$h = \frac{2s}{rpg}$$

$$\frac{\Delta s}{s} = \frac{\Delta h}{h} + \frac{\Delta r}{r} = \frac{2}{480} + \frac{0.02}{0.16} \approx 12.92\%$$

$$S = \frac{4.80 \times 0.16 \times 10^{-4} \times 10^9}{2} = 0.384 \text{ N/m}$$

$$T = 300 K, \quad I = 5 mA$$

$$5 = e^{\frac{1000V}{T}} - 1$$

$$e^{\frac{1000V}{T}} = 6$$

$$\text{Also, } \Delta I = e^{\frac{1000V}{T}} \times \frac{1000}{T} \times \Delta V$$

$$= 6 \times \frac{1000}{300} \times 0.01 mA = 0.2 mA$$

2. Ans. (4)

$$\ell = 3.50 cm$$

So LC of instrument is 0.01 cm

$$(1) LC = \frac{1 mm}{100} = 0.01 mm = 0.001 cm$$

So it can't be the answer

$$(2) LC = \frac{1 mm}{50} = 0.02 mm$$

(3) Meter scale has 1 cm as LC

$$(4) LC = 1 MSD - 1 VSD \left[\begin{array}{l} 10 VSD = 9 MSD \\ 1 VSD = 0.9 MSD \end{array} \right]$$

$$= 1 MSD - 0.9 MSD$$

$$= 0.1 MSD$$

$$\text{and } 1 MSD = \frac{1 cm}{10} = 0.1 cm$$

 $\therefore LC = 0.01 cm$ So this is correct option.

3. **Ans. (4)**

To make diode as forward biased the 'p' side (which is on left side here) should be at high potential than n side (which is at right side here.)

4. **Ans. (3)**

$$LC = \frac{0.5 \text{ mm}}{50} = 0.01 \text{ mm}$$

$$\begin{aligned} \text{Zero error} &= -0.5 \text{ mm} + 45(0.01) \\ &= -0.05 \text{ mm} \end{aligned}$$

$$\text{Reading taken} = 0.5 \text{ mm} + 25(0.01) = 0.75 \text{ mm}$$

$$\begin{aligned} \text{Actual reading} &= \text{Measured reading} - \text{zero error} \\ &= 0.75 \text{ mm} - (-0.05 \text{ mm}) \\ &= 0.80 \text{ mm} \end{aligned}$$

5. **Ans. (2)**

$$T_{avg} = \frac{90+91+95+92}{4} = 92 \text{ sec.}$$

$$\Delta T_{avg} = \frac{\sum_{i=1}^4 |\Delta T_i|}{4} = \frac{2+1+3+0}{4} = 1.5 \text{ sec.}$$

LC of $T_{avg}=92$ is 1 sec. So LC of ΔT_{avg} should also be 1 $\therefore \Delta T_{avg} \simeq 2 \text{ sec.}$

$$\therefore T = (92 \pm 2) \text{ sec.}$$

6. **Ans. (4)**

Output of OR gate is 0 when all inputs are 0 & output is 1 when at least one of the input is 1.

Zener diode works in breakdown region

So simple diode $\rightarrow$ (a), Solar cell $\rightarrow$ (c)

Zener diode $\rightarrow$ (b), Light dependent resistance $\rightarrow$ (d)

8. **Ans. (4)**

$$T = \frac{r h g}{2} \times 10^3$$

$$\begin{aligned} \frac{\Delta T}{T} \times 100 &= \frac{\Delta r}{r} \times 100 + \frac{\Delta h}{h} \times 100 \\ &= \left(\frac{0.01 \times 10^{-2}}{1.25 \times 10^{-2}} \times 100 + \frac{0.01 \times 10^{-2}}{1.45 \times 10^{-2}} \times 100 \right) \\ &= 1.5 \% \end{aligned}$$

Value of g is given, not measured so it has no error.

9. **Ans. (2)**

$$\rho = \frac{m}{a^3}$$

$$\begin{aligned} \frac{\Delta \rho}{\rho} \times 100 &= \frac{\Delta m}{m} \times 100 + 3 \frac{\Delta a}{a} \times 100 \\ &= (1.5 \%) + 3(1 \%) \\ &= 4.5 \% \end{aligned}$$

10. Ans. (4)

Assuming zener diode does not undergo breakdown, current in circuit = $\frac{120}{15000} = 8mA$

∴ Voltage drop across diode = $80V > 50V$.

The diode undergo breakdown.

$$\text{Current is } R_1 = \frac{70}{5000} = 14mA$$

$$\text{Current is } R_2 = \frac{50}{10000} = 5mA$$

∴ Current through diode = $9mA$

11. Ans. (3)

$$\ell = 25.0 \text{ cm} \Rightarrow \lambda.C. = 0.1 \text{ cm}$$

$$T = (50 \pm 1)s$$

$$\frac{\Delta g}{g} = \frac{\Delta \ell}{\ell} + \frac{2\Delta T}{T} = \frac{0.1}{25} + \frac{2 \times 1}{50} = 0.004 + 0.04 = 0.044$$

$$\Rightarrow \frac{\Delta g}{g} \times 100 = 4.4\%$$

$$n_e = \frac{n_i^2}{n_h} = \frac{(1.5 \times 10^{16})^2}{4.5 \times 10^{22}} = \frac{1.5 \times 1.5 \times 10^{32}}{4.5 \times 10^{22}}$$

Because diode will be in reverse biased state.

21. Ans. (4)

To convert pulsating dc into steady dc both of mentioned method are correct.

22. Ans. (4)

Truth table of the given gate:

A	B	C
0	0	0
0	1	1
1	0	0
1	1	0

Truth table of option (1)

A	B	C
0	0	1
0	1	1
1	0	0
1	1	1

Truth table of option (2)

A	B	C
0	0	1
0	1	0
1	0	1
1	1	1

Truth table of option (3)

A	B	C
0	0	1
0	1	0
1	0	0
1	1	0

Truth table of option (4)

A	B	C
0	0	0
0	1	1
1	0	0
1	1	0

Since option (1) has same truth table, hence answer is option (4) is correct.

Alternative solution :

Given Boolean expression can be written as

$$\overline{A + \bar{B}} = C$$

$$\therefore C = \bar{A} \cdot \bar{\bar{B}} = \bar{A} \cdot B$$

Hence option (4) is correct.

23. Ans. (2)

$$V_A = 5V \Rightarrow A = 1$$

$$V_A = 0V \Rightarrow A = 0$$

$$V_B = 5V \Rightarrow B = 1$$

$$V_B = 0V \Rightarrow B = 0$$

If $A = B = 0$, there is no potential anywhere here

$$V_0 = 0$$

If $A = 1, B = 0$, Diode D_1 is forward biased, here $V_0 = 5V$

If $A = 0, B = 1$, Diode D_2 is forward biased hence $V_0 = 5V$

If $A = 1, B = 1$, Both diodes are forward biased hence $V_0 = 5V$

Truth table for 1st

A	B	Output
0	0	0
0	1	1
1	0	1
1	1	1

∴ Given circuit is OR gate

For 2nd circuit

$$V_B = 5V, \quad A = 1$$

$$V_B = 0V, \quad A = 0$$

When $A = 0$, E-B junction is unbiased there is no current through it

$$\therefore V_0 = 1$$

When $A = 1$, E-B junction is forward biased

$$\therefore V_0 = 0$$

∴ Hence this circuit is not gate.

$$= \frac{0.01}{0.4} + \frac{2(0.03)}{6} + \frac{0.04}{8}$$

$$\Rightarrow \% \text{ error in density} = \left(\frac{d\rho}{\rho} \right) \times 100\%$$

$$V_C - V_A = 10 - 8 \text{ volt}$$

$$\therefore R = \frac{V_C - V_A}{i} = \frac{2V}{0.2A} = 10\Omega$$

[Note : A zener diode can regulate only if input voltage is $\geq$ zener breakdown voltage the range of input voltage should be 8 to 10 V so that output voltage remains constant = 8 V]

$$a + b = 14 \pm 0.14 \quad \Rightarrow \quad \% \text{ error} = \frac{0.14}{14} \times 100 = 1\%$$

$$a - b = 2 \pm 0.14 \quad \Rightarrow \quad \% \text{ error} = \frac{0.14}{2} \times 100 = 7\%$$

$$a \times b = 48 \pm 0.96 \quad \Rightarrow \quad \% \text{ error} = \frac{0.96}{48} \times 100 = 2\%$$

Order of % error $x < z < y$.

2. **Ans. (1)**

Volume of cube $\Rightarrow v = a^3$

$$a = 1.2 \times 10^{-2} \text{ m}$$

Significant digit = 2

$$V = a^3 \Rightarrow V = (1.2 \times 10^{-2} \text{ m})^3$$

$$\Rightarrow V = 1.728 \times 10^{-6} \text{ m}^3$$

In this operation, minimum two significant digit is involved during multiplication of side.

The answer expressed with least significant digit hence volume expressed with two significant digit only.

$$V = 1.7 \times 10^{-6} \text{ m}^3$$

$$1VSD = \frac{2.45}{50} \text{ cm}$$

$$\text{Least count} = 1MSD - 1VSD$$

$$\Rightarrow LC = 0.05 \text{ cm} - \frac{2.45}{50} \text{ cm}$$

$$\Rightarrow LC = 0.001 \text{ cm}$$

$$(ii) \text{ One circular scale division} = 0.01 \text{ mm}$$

$$\text{Least count} = 0.01 \text{ mm} = 0.001 \text{ cm}$$

$$\Delta \ell = \text{Quarter turn} = \frac{\text{Pitch}}{4} = \frac{1}{4} \text{ mm}$$

$$\Rightarrow \Delta \ell = 0.25 \times 10^{-3} \text{ m}$$

$$\ell = 3 \text{ m, Load } (W) = 50 \text{ kg}$$

$$A = 10^{-5} \text{ m}^2$$

$$Y = \frac{\frac{F}{A}}{\frac{\Delta \ell}{\ell}} = \frac{F \ell}{A \Delta \ell} = \frac{500 \times 3}{10^{-5} \times 0.25 \times 10^{-3}}$$

$$Y = 6 \times 10^{11} \text{ N/m}^2$$

5. **Ans. (2)**

6. **Ans. (3)**

The P -type semiconductor is formed when the trivalent impurity is added to the pure semiconductor.

7. **Ans. (2)**

Temperature coefficient is positive for conductors, so for copper as $T \downarrow \Rightarrow \rho \downarrow$

For semiconductor temperature coefficient $-ve$ then for germanium as $T \downarrow \Rightarrow \rho \uparrow$.

8. **Ans. (4)**

As we know from theory of diode that the forward bias resistance of diode is very high; almost infinity for small values of V and after a certain value it becomes very low and the reverse bias resistance of diode is very high in the beginning up to breakdown voltage is not achieved.

9. **Ans. (2)**

When $+ve$ terminal is connected to A , D_2 is reversed biased & D_1 will forward biased.

$$i = \frac{2}{5} = 0.4A$$

When $+ve$ terminal is connected to B , D_1 is reversed biased and D_2 is forward biased.

$$i' = \frac{2}{10} = 0.2A$$

10. **Ans. (2)**

In reverse bias, current will be blocked by diode.

11. **Ans. (2)**

Circuit is closed when neither A nor B is closed $\Rightarrow$ current flows for $A = 0, B = 0$ when either or both of A and B is closed we get current bypass from switch

Hence it is "NOR" gate.

12. **Ans. (1)**

$$Y = \overline{\overline{a} + \overline{b}} = a \cdot b$$

The truth table for the given circuit will be

a	b	output
0	0	0
0	1	0
1	0	0
1	1	1

Hence it will be equivalent to AND gate.

13. **Ans. (1)**

Truth table for NAND gate is

A	B	$Y = \overline{A \cdot B}$
0	0	1
0	1	1
1	0	1
1	1	0

On the basis of given input A and B the truth table is

A	B	Y
1	1	0
0	0	1
0	1	1
1	0	1
1	1	0
0	0	1
0	1	1

So the correct answer is Option 1.

$$1 \text{ VSD} = \frac{9}{200} cm$$

$$VC = 1 \text{ MSD} - 1 \text{ VSD}$$

$$= \frac{1}{20} cm - \frac{9}{200} cm$$

$$0.322 = 0.300 + \text{CSR} + 0.005$$

$$\text{CSR} = 0.017$$

For (B)

$$0.322 = 0.200 + \text{CSR} + 0.092$$

$$\text{CSR} = 0.030$$

$$\text{Difference} = 0.030 - 0.017 = 0.013 \text{ cm}$$

$$\text{Division on circular scale} = \frac{0.013}{0.001} = 13$$
