

06

Redox Reactions

Introduction :

Redox reactions show vital role in non renewable energy sources. In cell reactions where oxidation and reduction both occurs simultaneously will have redox reaction for interconversion of energy.

Redox Reactions (Oxidation-Reduction) :

Many chemical reactions involve transfer of electrons from one chemical substance to another. These electron-transfer reactions are termed as **oxidation-reduction** or **redox reactions**.

Or

Those reactions which involve oxidation and reduction both simultaneously are known as oxidation reduction or redox reactions.

Or

Those reactions in which increase and decrease in oxidation number of same or different atoms occurs are known as redox reactions.

Oxidation and Reduction :

There are two concepts of oxidation and reduction.

(A) Classical/old concept :

	OXIDATION	REDUCTION
(1)	Addition of O ₂ $2\text{Mg} + \text{O}_2 \rightarrow 2\text{MgO}$ $\text{C} + \text{O}_2 \rightarrow \text{CO}_2$	Addition of H ₂ $\text{N}_2 + 3\text{H}_2 \rightarrow 2\text{NH}_3$ $\text{H}_2 + \text{Cl}_2 \rightarrow 2\text{HCl}$
(2)	Removal of H ₂ $\text{H}_2\text{S} + \text{Cl}_2 \rightarrow 2\text{HCl} + \text{S}$ (oxidation of H ₂ S) $4\text{HI} + \text{O}_2 \rightarrow 2\text{I}_2 + 2\text{H}_2\text{O}$ (oxidation of HI)	Removal of O ₂ $\text{CuO} + \text{C} \rightarrow \text{Cu} + \text{CO}$ (reduction of CuO) $\text{H}_2\text{O} + \text{C} \rightarrow \text{CO} + \text{H}_2$ (reduction of H ₂ O)
(3)	Addition of electronegative element $\text{Fe} + \text{S} \rightarrow \text{FeS}$ (oxidation of Fe) $\text{SnCl}_2 + \text{Cl}_2 \rightarrow \text{SnCl}_4$ (oxidation of SnCl ₂)	Addition of electropositive element $\text{CuCl}_2 + \text{Cu} \rightarrow \text{Cu}_2\text{Cl}_2$ (reduction of CuCl ₂) $\text{HgCl}_2 + \text{Hg} \rightarrow \text{Hg}_2\text{Cl}_2$ (reduction of HgCl ₂)
(4)	Removal of electropositive element $2\text{NaI} + \text{H}_2\text{O}_2 \rightarrow 2\text{NaOH} + \text{I}_2$ (oxidation of NaI)	Removal of electronegative element $2\text{FeCl}_3 + \text{H}_2 \rightarrow 2\text{FeCl}_2 + 2\text{HCl}$ (reduction of FeCl ₃)

(B) Electronic/Modern Concept :

	OXIDATION	REDUCTION
(1)	De-electronation	Electronation
(2)	Oxidation process is that process in which one or more electrons are lost by an atom, ion or molecule.	Reduction process is that process in which one or more electrons are gained by an atom, ion or molecule.
(3)	Example – (a) $\text{Zn} \rightarrow \text{Zn}^{+2} + 2\text{e}^-$ $\text{M} \rightarrow \text{M}^{n+} + n\text{e}^-$ (b) $\text{Sn}^{+2} \rightarrow \text{Sn}^{+4} + (4-2)\text{e}^-$ $\text{M}^{+n_1} \rightarrow \text{M}^{+n_2} + (n_2 - n_1)\text{e}^-$ (c) $\text{Cl}^- \rightarrow \text{Cl} + \text{e}^-$ $\text{A}^{-n} \rightarrow \text{A} + n\text{e}^-$ (d) $\text{MnO}_4^{-2} \rightarrow \text{MnO}_4^- + (2-1)\text{e}^-$ $\text{A}^{-n_1} \rightarrow \text{A}^{-n_2} + (n_1 - n_2)\text{e}^-$	(a) $\text{Cu}^{+2} + 2\text{e}^- \rightarrow \text{Cu}$ $\text{M}^{n+} + n\text{e}^- \rightarrow \text{M}$ (b) $\text{Fe}^{+3} + (3-2)\text{e}^- \rightarrow \text{Fe}^{+2}$ $\text{M}^{+x_1} + (x_1 - x_2)\text{e}^- \rightarrow \text{M}^{+x_2}$ (c) $\text{O} + 2\text{e}^- \rightarrow \text{O}^{2-}$ $\text{A} + x\text{e}^- \rightarrow \text{A}^{-x}$ (d) $[\text{Fe}(\text{CN})_4]^{3-} + (4-3)\text{e}^- \rightarrow [\text{Fe}(\text{CN})_4]^{4-}$ $\text{A}^{-n_1} + (n_2 - n_1)\text{e}^- \rightarrow \text{A}^{-n_2}$

Oxidation State :

Oxidation state of an atom in a molecule or ion is the hypothetical or real charge present on an atom due to electronegativity difference.

Or

Oxidation state of an element in a compound represents the number of electrons lost or gained during its change from free state into that compound.

Some important points about oxidation number :

- Electronegativity values of no two elements are same –
 $\text{P} > \text{H}$ $\text{C} > \text{H}$ $\text{S} > \text{C}$ $\text{Cl} > \text{N}$
- Oxidation number of an element may be positive or negative.
- Oxidation number can be zero, whole number or a fractional value.
 Ex. $\text{Ni}(\text{CO})_4 \Rightarrow \text{O.S of Ni} = 0$
 $\text{N}_3\text{H} \Rightarrow \text{O.S of N} = -1/3$
 $\text{HCl} \Rightarrow \text{O.S of Cl} = -1$
- Oxidation state of same element can be different in same or different compounds.
 Ex. $\text{H}_2\text{S} \Rightarrow \text{O.S of S} = -2$
 $\text{H}_2\text{SO}_3 \Rightarrow \text{O.S of S} = +4$
 $\text{H}_2\text{SO}_4 \Rightarrow \text{O.S of S} = +6$

Some Helping Rules for Calculating Oxidation Number :

(A) In case of covalent bond :

- (i) For homoatomic molecule

	A – A	A = A	A ≡ A
	↓ ↓	↓ ↓	↓ ↓
O.N. :	0 0	0 0	0 0

- (ii) For heteroatomic molecule (EN of B > A)

	A - B		A = B		A ≡ B	
	↓	↓	↓	↓	↓	↓
O.N.:	+1	-1	+2	-2	+3	-3

- (iii) The oxidation state of an element in its
- free state is zero**
- .

Ex. Oxidation state of Na, Cu, I, Cl, O etc. are zero.

- (iv) Oxidation state of atoms present in homoatomic molecules is zero.

Ex. H_2, O_2, N_2, P_4, S_8

- (v) Oxidation state of an element in any of its allotropic form is zero.

Ex. $C_{\text{Diamond}}, C_{\text{Graphite}}, S_{\text{Monoclinic}}, S_{\text{Rhombic}}$

- (vi) Oxidation state of all the components of an alloy are zero.

(Na - Hg)

Ex. ↓ ↓

 0 0

- (vii) In complex compounds, oxidation state of metal in metal carbonyl is zero.

- (viii) Oxidation state of fluorine in all its compounds is -1.

- (ix) Oxidation state of IA & II A group elements are +1 and +2 respectively.

- (x) Oxidation state of hydrogen in most of its compounds is +1 except in metal hydrides (-1)

Ex.	NaH		LiH		CaH ₂		MgH ₂	
	↓	↓	↓	↓	↓	↓	↓	↓
O.S.:	+1	-1	+1	-1	+2	-1	+2	-1

- (xi) Oxidation state of oxygen in most of its compounds is -2 except in-

- (a) Peroxides (
- O_2^{-2}
-) → Oxidation state (O) = -1

Ex. H_2O_2, BaO_2

- (b) Super Oxides (
- O_2^{-1}
-) → Oxidation state (O) = -1/2

Ex. KO_2

 ↓

 -1/2

- (c) Ozonide (
- O_3^{-1}
-) → Oxidation state (O) = -1/3

Ex. KO_3

 ↓

 -1/3

- (d)
- OF_2
- (Oxygen difluoride)

F - O - F

 ↓

 Oxidation state (O) = +2

- (e)
- O_2F_2
- (dioxygen difluoride)

 ↓

 Oxidation state (O) = +1

- (xii) Oxidation state of monoatomic ions is equal to the charge present on the ion.

Ex. $Mg^{+2} \rightarrow$ Oxidation state = +2

(xiii) The algebraic sum of oxidation states of all the atoms present in a polyatomic neutral molecule is 0.

If O.S of S is x then

$$2(+1) + x + 4(-2) = 0$$

$$x - 6 = 0$$

$$x = +6$$

If O.S of S is x then

$$2(+1) + x + 3(-2) = 0$$

$$x - 4 = 0$$

$$x = +4$$

(xiv) The algebraic sum of oxidation state of all the atoms in a polyatomic ion is equal to the charge present on the ion.

If O.S of S is x then

$$x + 4(-2) = -2$$

$$x - 6 = 0$$

$$x = +6$$

If O.S of C is x then

$$+1 + x + 3(-2) = -1$$

$$x - 4 = 0$$

$$x = +4$$

(B) In case of co-ordinate bond (EN of B > A) :

	$A \rightarrow A$		$B \rightarrow B$		$A \rightarrow B$		$B \rightarrow A$	
	↓	↓	↓	↓	↓	↓	↓	↓
O.S.:	+2	-2	+2	-2	+2	-2	0	0

(C) In case of Ionic bond :

Charge on cation = O.S of cation

Charge on anion = O.S of anion

Ex.	$\text{NaCl} \rightarrow$	Na^+	+	Cl^-
		↓		↓
		+1		-1
	$\text{MgCl}_2 \rightarrow$	Mg^{+2}	+	2Cl^-
		↓		↓
		+2		-1

Illustration 1:

Oxidation number of cobalt in $[\text{Co}(\text{NH}_3)_6] \text{Cl}_2\text{Br}$ is –

- (1) +6 (2) Zero (3) +3 (4) +2

Solution :

Let the oxidation number of Co be x

NH_3 is a neutral ligand

Oxidation number of Cl is –1

Oxidation number of Br is –1

Hence, $x + 6(0) - (1 \times 2) - 1 = 0$

$\therefore x = +3$

So, the oxidation number of cobalt in the given complex compound is +3.

Illustration 2:

The order of increasing oxidation numbers of S in S_8 , $\text{S}_2\text{O}_8^{2-}$, $\text{S}_2\text{O}_3^{2-}$, $\text{S}_4\text{O}_6^{2-}$ is given below –

- (1) $\text{S}_8 < \text{S}_2\text{O}_8^{2-} < \text{S}_2\text{O}_3^{2-} < \text{S}_4\text{O}_6^{2-}$ (2) $\text{S}_2\text{O}_8^{2-} < \text{S}_2\text{O}_3^{2-} < \text{S}_4\text{O}_6^{2-} < \text{S}_8$
 (3) $\text{S}_2\text{O}_8^{2-} < \text{S}_8 < \text{S}_4\text{O}_6^{2-} < \text{S}_2\text{O}_3^{2-}$ (4) $\text{S}_8 < \text{S}_2\text{O}_3^{2-} < \text{S}_4\text{O}_6^{2-} < \text{S}_2\text{O}_8^{2-}$

Solution :

The oxidation number of S are shown below along with the compounds

S_8	$\text{S}_2\text{O}_8^{2-}$	$\text{S}_2\text{O}_3^{2-}$	$\text{S}_4\text{O}_6^{2-}$
0	+6	+2	+2.5

Hence the order of increasing oxidation state of S is –

$\text{S}_8 < \text{S}_2\text{O}_3^{2-} < \text{S}_4\text{O}_6^{2-} < \text{S}_2\text{O}_8^{2-}$

Illustration 3:

The oxidation number of Cl in NOClO_4 is –

- (1) +11 (2) +9 (3) +7 (4) +5

Solution :

The compound may be written as $\text{NO}^+ \text{ClO}_4^-$.

For ClO_4^- , Let oxidation number of Cl = a

$$a + 4 \times (-2) = -1$$

$$a = +7$$

Hence, the oxidation number of Cl in NOClO_4 is + 7

Illustration 4:

The two possible oxidation states of N atoms in NH_4NO_3 are respectively –

- (1) +3, +5 (2) +3, –5 (3) –3, +5 (4) –3, –5

Solution :

There are two N atoms in NH_4NO_3 , but one N atom has negative oxidation states (attached to H) and the other has positive oxidation states (attached to O). Therefore evaluation should be made separately as –

Oxidation state of N in NH_4^+ Oxidation state of N in NO_3^-

$$a + 4 \times (+1) = +1$$

$$\text{and } a + 3(-2) = -1$$

$$\therefore a = -3$$

$$\therefore a = +5$$

Here the two oxidation states are –3 and +5 respectively.

Illustration 5:

The oxidation states of S in $\text{H}_2\text{S}_2\text{O}_8$ is –

- (1) +8 (2) –8 (3) +6 (4) +4

Solution :

In $\text{H}_2\text{S}_2\text{O}_8$, two O atoms form peroxide linkage i.e.

$$2 \times 1 + 2a + 6(-2) + 2(-1) = 0$$

$$\therefore a = +6$$

Thus the oxidation states of S in $\text{H}_2\text{S}_2\text{O}_8$ is +6

Illustration 6:

The oxidation number of S in $(\text{CH}_3)_2\text{SO}$ is –

- (1) 1 (2) 2 (3) 0 (4) 3

Solution :

Let the oxidation number of S is 'a'

Oxidation number of $\text{CH}_3 = +1$

Oxidation number of O = –2

$$2(+1) + a + (-2) = 0$$

$$a = 0$$

Hence the oxidation no. of S in dimethyl sulphoxide is zero.

**BEGINNER'S BOX-1**

- In which of the following compounds, the oxidation state of I-atom is highest ?
(1) KI_3 (2) KIO_4 (3) KIO_3 (4) IF_5 **CRR114**
- The oxidation number of phosphorus in $\text{Ba}(\text{H}_2\text{PO}_2)_2$ is –
(1) +3 (2) +2 (3) +1 (4) –1 **CRR115**
- Oxidation number of Ni in $\text{Ni}(\text{CO})_4$ is –
(1) 0 (2) 4 (3) 8 (4) 2 **CRR116**
- Positive oxidation state of an element indicates that it is –
(1) Elementary form (2) Oxidised (3) Reduced (4) Only reductant **CRR117**
- Predict the highest and lowest oxidation state of (a) Ti and (b) Tl in combined state.
(1) a[0, +3] b[0, +2] (2) a[+3, 0] b[+4, 0] (3) a[+4, 0] b[+4, 0] (4) a[+4, +2] b[+3, +1] **CRR118**
- The oxidation state of oxygen atom in potassium superoxide is –
(1) Zero (2) –1/2 (3) –1 (4) –2 **CRR119**

Oxidising and Reducing Nature of the Substances :

Oxidising agents are the substances which accept electrons in a chemical reaction i.e., electron acceptors are oxidising agent.

Reducing agents are the substances which donate electrons in a chemical reaction i.e., electron donors are reducing agent.

Highest O.S.	+4	+5	+5	+6	+7	+6	+7	+8	+8	+2	+1
Elements	C	N	P	S	Cl	Cr	Mn	Os	Ru	O	H
Lowest O.S.	-4	-3	-3	-2	-1	0	0	0	0	-2	-1

- (a) If effective element in a compound is present in maximum oxidation state then the compound acts as oxidising agent.

Ex.	KMnO ₄	K ₂ Cr ₂ O ₇	H ₂ SO ₄	SO ₃	H ₃ PO ₄	HNO ₃	HClO ₄
	↓	↓	↓	↓	↓	↓	↓
	+7	+6	+6	+6	+5	+5	+7

- (b) If effective element in a compound is present in minimum oxidation state then the compound acts as reducing agent.

PH ₃	NH ₃	CH ₄
↓	↓	↓
-3	-3	-4

- (c) If effective element in a compound is present in intermediate oxidation state then the compound can act as oxidising agent as well as reducing agent.

HNO ₂	H ₃ PO ₃	SO ₂	H ₂ O ₂
↓	↓	↓	↓
+3	+3	+4	-1

Types of Redox Reactions :

- (A) **Intermolecular redox reaction :-** When oxidation and reduction takes place separately in different compounds, then the reaction is called intermolecular redox reaction.

- (B) **Intramolecular redox reaction :-** During the chemical reaction, if oxidation and reduction takes place in single compound then the reaction is called intramolecular redox reaction.

- (C) **Disproportionation reaction** :- When reduction and oxidation takes place in the same element of the same compound in a reaction then the reaction is called disproportionation reaction.

- (D) **Comproportionation reaction**: Reverse of disproportionation reaction known as comproportionation reaction.

Ex.

BEGINNER'S BOX-2

- Oxidation is defined as –

(1) Gain of electrons	(2) Decrease in positive valency
(3) Loss of electrons	(4) Addition of electropositive element

CRR120
- Reduction is defined as –

(1) Increase in positive valency	(2) Gain of electrons
(3) Loss of protons	(4) Decrease in negative valency

CRR121
- In the reaction $\text{MnO}_4^- + \text{SO}_3^{2-} + \text{H}^+ \longrightarrow \text{SO}_4^{2-} + \text{Mn}^{2+} + \text{H}_2\text{O}$

(1) MnO_4^- and H^+ both are reduced	(2) MnO_4^- is reduced and H^+ is oxidised
(3) MnO_4^- is reduced and SO_3^{2-} is oxidised	(4) MnO_4^- is oxidised and SO_3^{2-} is reduced

CRR122
- The charge on cobalt in $[\text{Co}(\text{CN})_6]^{-3}$ is –

(1) -6	(2) -3	(3) +3	(4) +6
--------	--------	--------	--------

CRR123
- Which of the following halogen always show only one oxidating state in its compounds?

(1) Cl	(2) F	(3) Br	(4) I
--------	-------	--------	-------

CRR124
- Which of the following reactions do not involve oxidation-reduction ?

(1) $2\text{Rb} + 2\text{H}_2\text{O} \longrightarrow 2\text{RbOH} + \text{H}_2$	(2) $2\text{CuI}_2 \longrightarrow 2\text{CuI} + \text{I}_2$
(3) $\text{NH}_4\text{Cl} + \text{NaOH} \longrightarrow \text{NaCl} + \text{NH}_3 + \text{H}_2\text{O}$	(4) $3\text{Mg} + \text{N}_2 \longrightarrow \text{Mg}_3\text{N}_2$

CRR125
- The fast reaction between water and sodium is the example of –

(1) Oxidation	(2) Reduction
(3) Intermolecular redo	(4) Intramolecular redox

CRR126
- Choose the redox reaction from the following–

(1) $\text{Cu} + 2\text{H}_2\text{SO}_4 \longrightarrow \text{CuSO}_4 + \text{SO}_2 + 2\text{H}_2\text{O}$	(2) $\text{BaCl}_2 + \text{H}_2\text{SO}_4 \longrightarrow \text{BaSO}_4 + 2\text{HCl}$
(3) $2\text{NaOH} + \text{H}_2\text{SO}_4 \longrightarrow \text{Na}_2\text{SO}_4 + 2\text{H}_2\text{O}$	(4) $\text{KNO}_3 + \text{H}_2\text{SO}_4 \longrightarrow 2\text{HNO}_3 + \text{K}_2\text{SO}_4$

CRR127

Redox Reactions

9. Which of the following is not a redox reaction ?

CRR128

10. In the reaction $6\text{Li} + \text{N}_2 \longrightarrow 2\text{Li}_3\text{N}$

(1) Li undergoes reduction

(2) Li undergoes oxidation

(3) N undergoes oxidation

(4) Li is oxidant

CRR129

11. $\text{H}_2\text{O}_2 + \text{H}_2\text{O}_2 \longrightarrow 2\text{H}_2\text{O} + \text{O}_2$ is an example of disproportionation because –

(1) Oxidation number of oxygen only decreases

(2) Oxidation number of oxygen only increases

(3) Oxidation number of oxygen decreases as well as increase

(4) Oxidation number of oxygen neither decreases nor increases

CRR130

Balancing of Redox Reactions :

(A) Ion-Electron method :-

This method was given by Jette and La Mev in 1972.

The following steps are followed while balancing redox reaction (equations) by this method.

- (i) Write the equation in ionic form.
- (ii) Split the redox equation into two half reactions, one representing oxidation and the other representing reduction.
- (iii) Balance these half reactions separately and then add by multiplying with suitable coefficients so that the electrons are cancelled. Balancing is done using following substeps.
 - (a) Balance all other atoms except H and O in both half reactions.
 - (b) Then balance oxygen atoms by adding H_2O molecules to the side deficient in oxygen. The number of H_2O molecules added is equal to the deficiency of oxygen atoms.
 - (c) Balance hydrogen atoms by adding H^+ ions equal to the deficiency in the side which is deficient in hydrogen atoms.
 - (d) Balance the charge by adding electrons to the side which is rich in +ve charge. i.e. deficient in electrons. Number of electrons added is equal to the deficiency.
 - (e) Multiply the half equations with suitable coefficients to equalize the number of electrons.

- (iv) Add these half equations to get an equation which is balanced with respect to charge and atoms.
 (v) If the medium of reaction is basic, OH^- ions are added to both sides of balanced equation, which is equal to number of H^+ ions in Balanced Equation.

Illustration 7:

Balance the following reaction by ion-electron method in acidic medium :

Solution :

- (a) Write both the half reaction.

- (b) Atoms other than H and O are balanced.

- (c) Balance O-atoms by the addition of H_2O to another side

- (d) Balance H-atoms by the addition of H^+ to another side

- (e) Now, balance the charge by the addition of electron (e^-).

- (f) Multiply equations by a constant number to get the same number of electrons on both side. In the above case second equation is multiplied by 3 and then added to first equation.

Illustration 8:

Balance the following reaction by ion-electron method in basic medium :

Solution :

- (a) Separate the two half reactions.

- (b) Balance O-atoms by adding H_2O .

- (c) Balance H-atoms by adding H^+ to side having deficiency and add equal no. of OH^- ions to both side (medium is known)

- (d) Balance the charges by adding electrons

- (e) Multiply first equation by 2 and add to second to give

(B) Oxidation number change method :

This method was given by Johnson. In a balanced redox reaction, total increase in oxidation number must be equal to total decreases in oxidation number. This equivalence provides the basis for balancing redox reactions.

The general procedure involves the following steps :

- Select the atom in oxidising agent whose oxidation number decreases and indicate the gain of electrons.
- Select the atom in reducing agent whose oxidation number increases and indicate the loss of electrons.
- Now cross multiply i.e. multiply oxidising agent by the number of loss of electrons and reducing agent by number of gain of electrons.
- Balance the number of atoms on both sides whose oxidation numbers change in the reaction.
- In order to balance oxygen atoms, add H_2O molecules to the side deficient in oxygen.
- Then balance the number of H atoms by adding H^+ ions to the side deficient in hydrogen.

Illustration 9:

Balance the following reaction by the oxidation number method –

Solution :

Write the oxidation number of all the atoms.

There is change in oxidation number of Cu and N.

To make increase and decrease equal, eq. (2) is multiplied by 2.

Balancing nitrates ions, hydrogen and oxygen, the following equation is obtained.

This is the balanced equation.

Illustration 10:

Balance the following reaction by the oxidation number method –

Solution :

Write the oxidation number of all the atoms.

change in oxidation number has occurred in Mn and Fe.

To make increase and decrease equal, eq. (2) is multiplied by 5.

To balance oxygen, 4H₂O are added to R.H.S. and to balance hydrogen, 8H⁺ are added to L.H.S.

This is the balanced equation.

BEGINNER'S BOX-3

1. In the half reaction : $2\text{ClO}_3^- \longrightarrow \text{Cl}_2$

(1) 5 electrons are gained

(2) 5 electrons are liberated

(3) 10 electrons are gained

(4) 10 electrons are liberated

CRR131

2. The number of electrons required to balance the following equation –

(1) 5

(2) 4

(3) 3

(4) 2

CRR132

3. Which of the following equations is a balanced one –

CRR133

Equivalent Weight of Compounds :

The equivalent weight of an oxidising agent or reducing agent is that weight which accepts or loses one mole electrons in a chemical reaction.

$$(a) \quad \text{Equivalent weight of oxidant} = \frac{\text{Molecular weight}}{\text{No. of electrons gained by one mole of oxidant}}$$

Example :

In acidic medium

Here atoms which undergoes reduction is Cr. Its O. S. is decreasing from +6 to +3

$$\text{Equivalent weight of } \text{K}_2\text{Cr}_2\text{O}_7 = \frac{\text{Molecular weight of } \text{K}_2\text{Cr}_2\text{O}_7}{3 \times 2} = \frac{M}{6}$$

Note : [6 in denominator indicates that 6 electrons were gained by $\text{Cr}_2\text{O}_7^{2-}$ as it is clear from the given balanced equation]

$$(b) \quad \text{Equivalent weight of a reductant} = \frac{\text{Molecular weight}}{\text{No. of electrons lost by one mole of reductant}}$$

Here, atoms which undergoes oxidation is C. Its oxidation state is increasing from +3 to +4.

Here, Total electrons lost in $\text{C}_2\text{O}_4^{2-} = 2$ So, equivalent weight of $\text{C}_2\text{O}_4^{2-} = \frac{M}{2}$

(c) **In different conditions a compound may have different equivalent weight because, it depends upon the number of electrons gained or lost by that compound in that reaction.**

Example :

Here 5 electrons are taken by MnO_4^- so its equivalent weight $= \frac{M}{5} = \frac{158}{5} = 31.6$

Here, only 3 electrons are gained by MnO_4^- so its equivalent weight $= \frac{M}{3} = \frac{158}{3} = 52.7$

Note : When only alkaline medium is given consider it as weak alkaline medium.

Here, only one electron is gained by MnO_4^- so its equivalent weight $= \frac{M}{1} = 158$

Note : KMnO_4 acts as an oxidant in every medium although with different strength which follows the order –

acidic medium > neutral medium > alkaline medium

while, $\text{K}_2\text{Cr}_2\text{O}_7$ acts as an oxidant only in acidic medium as follows

Here, 6 electrons are gained by $\text{K}_2\text{Cr}_2\text{O}_7$ equivalent weight $= \frac{M}{6} = \frac{294}{6} = 49$

Molecular Formula of Compound :

Since the sum of oxidation number of all the atoms present in a compound is zero, so the validity of the formula can be confirmed.

**Some Oxidizing Agents/Reducing Agents with Equivalent Weight:**

Species	Changed to	Reaction	Electrons exchanged or change in O.N.	Eq. wt.
MnO_4^- (O.A.)	Mn^{+2} in acidic medium	$\text{MnO}_4^- + \text{H}^+ + 5\text{e}^- \rightarrow \text{Mn}^{2+} + 4\text{H}_2\text{O}$	5	$E = \frac{M}{5}$
MnO_4^- (O.A.)	MnO_2 in neutral medium or in weak alkaline medium	$\text{MnO}_4^- + 3\text{e}^- + 2\text{H}_2\text{O} \rightarrow \text{MnO}_2 + 4\text{OH}^-$	3	$E = \frac{M}{3}$
MnO_4^- (O.A.)	MnO_4^{2-} in strong alkaline medium	$\text{MnO}_4^- + \text{e}^- \rightarrow \text{MnO}_4^{2-}$	1	$E = \frac{M}{1}$
$\text{Cr}_2\text{O}_7^{2-}$ (O.A.)	Cr^{3+} in acidic medium	$\text{Cr}_2\text{O}_7^{2-} + 14\text{H}^+ + 6\text{e}^- \rightarrow 2\text{Cr}^{3+} + 7\text{H}_2\text{O}$	6	$E = \frac{M}{6}$
MnO_2 (O.A.)	Mn^{2+} in acidic medium	$\text{MnO}_2 + 4\text{H}^+ + 2\text{e}^- \rightarrow \text{Mn}^{2+} + 2\text{H}_2\text{O}$	2	$E = \frac{M}{2}$
Cl_2 (O.A.) in bleaching powder	Cl^-	$\text{Cl}_2 + 2\text{e}^- \rightarrow 2\text{Cl}^-$	2	$E = \frac{M}{2}$
CuSO_4 (O.A.) in iodometric titration	Cu^+	$\text{Cu}^{2+} + \text{e}^- \rightarrow \text{Cu}^+$	1	$E = \frac{M}{1}$
$\text{S}_2\text{O}_3^{2-}$ (R.A.)	$\text{S}_4\text{O}_6^{2-}$	$2\text{S}_2\text{O}_3^{2-} \rightarrow \text{S}_4\text{O}_6^{2-} + 2\text{e}^-$	2 (for two moles)	$E = \frac{2M}{2} = M$
H_2O_2 (O.A.)	H_2O	$\text{H}_2\text{O}_2 + 2\text{H}^+ + 2\text{e}^- \rightarrow 2\text{H}_2\text{O}$	2	$E = \frac{M}{2}$
H_2O_2 (R.A.)	O_2	$\text{H}_2\text{O}_2 \rightarrow \text{O}_2 + 2\text{H}^+ + 2\text{e}^-$ (O.N. of oxygen in H_2O_2 is -1 per atom)	2	$E = \frac{M}{2}$
Fe^{2+} (R.A.)	Fe^{3+}	$\text{Fe}^{2+} \rightarrow \text{Fe}^{3+} + \text{e}^-$	1	$E = \frac{M}{1}$
I^- (R.A.)	I_2 (in acidic medium)	$2\text{I}^- \rightarrow \text{I}_2 + 2\text{e}^-$	2 (for two moles)	$E = \frac{M}{1}$
I^- (R.A.)	IO_3^- (in basic medium)	$\text{I}^- + 6\text{OH}^- \rightarrow \text{IO}_3^- + 3\text{H}_2\text{O} + 6\text{e}^-$	6	$E = \frac{M}{6}$

Illustration 11:

Find the n-factor of reactant in the following chemical changes.

**Solution :**

(i) In this reaction, KMnO_4 which is an oxidizing agent, itself gets reduced to Mn^{2+} under acidic conditions.

$$n = |1 \times (+7) - 1 \times (+2)| = 5$$

(ii) In this reaction, KMnO_4 gets reduced to Mn^{4+} under neutral or slightly (weakly) basic conditions.

$$n = |1 \times (+7) - 1 \times (+4)| = 3$$

(iii) In this reaction, KMnO_4 gets reduced to Mn^{6+} under basic conditions.

$$n = |1 \times (+7) - 1 \times (+6)| = 1$$

(iv) In this reaction, $\text{K}_2\text{Cr}_2\text{O}_7$ which acts as an oxidizing agent reduced to Cr^{3+} under acidic conditions. (It does not react under basic conditions.)

$$n = |2 \times (+6) - 2 \times (+3)| = 6$$

(v) In this reaction, $\text{C}_2\text{O}_4^{2-}$ (oxalate ion) gets oxidized to CO_2 when it is reacted with an oxidizing agent.

$$n = |2 \times (+3) - 2 \times (+4)| = 2$$

(vi) In this reaction, ferrous ions get oxidized to ferric ions.

$$n = |1 \times (+2) - 1 \times (+3)| = 1$$

(vii) In this reaction, ferric ions are getting reduced to ferrous ions.

$$n = |2 \times (+3) - 2 \times (+2)| = 2$$

Illustration 12:

Suppose that there are three atoms A, B, C and their oxidation numbers are 6, -1, -2, respectively. Then the molecular formula of compound will be.

Solution :

Since, the charge on a free compound is zero. So

$$+6 = (-1 \times 4) + (-2)$$

$$+6 = -6$$

or $+6 = (-1 \times 2) + (-2 \times 2)$

$$= -2 + (-4) = -6$$

So molecular formula, AB_4C or AB_2C_2 .

BEGINNER'S BOX-4

- Molecular weight of KMnO_4 in acidic medium and neutral medium will be respectively –
 (1) 7 equivalent weight and 2 equivalent weight
 (2) 5 equivalent weight and 3 equivalent weight
 (3) 4 equivalent weight and 5 equivalent weight
 (4) 2 equivalent weight and 4 equivalent weight

CRR134

- In acidic medium, equivalent weight of $\text{K}_2\text{Cr}_2\text{O}_7$ (Molecular weight = M) is –
 (1) $M/3$ (2) $M/4$ (3) $M/6$ (4) $M/2$

CRR135

Law of Equivalence :

The law states that one equivalent of an element combine with one equivalent of the other and in a chemical reaction equal number of equivalents or milli equivalents of reactants react to give equal number of equivalents or milli equivalents of products separately.

According to law of equivalence:

m. eq of A = number of m. eq of B = number of m. eq of M = number of m. eq of N

Number of m. eq of M_xN_y = m.eq of M = number of m.eq of N

For Redox Reactions :

Number of m. eq. of oxidant = Number of m. eq. of reductant

$N_1V_1 = N_2V_2$ is always true.

But $(M_1 \times V_1) \times n_1 = (M_2 \times V_2) \times n_2$ (always true where n term represents valency factor).

Illustration 13:

Calculate the normality of a solution containing 15.8 g of KMnO_4 in 50 mL acidic solution.

Solution :

$$\text{Normality (N)} = \frac{W \times 1000}{E \times V(\text{mL})}$$

Where, $W = 15.8 \text{ g}$, $V = 50 \text{ mL}$

$$E = \frac{\text{molar mass of } \text{KMnO}_4}{\text{Valence factor}} = 158/5 = 31.6$$

So, Normality = 10 N

Illustration 14:

Calculate the normality of a solution containing 50 mL of 5 M solution $\text{K}_2\text{Cr}_2\text{O}_7$ in acidic medium.

Solution :

Normality (N) = Molarity $\times$ Valency factor = $5 \times 6 = 30 \text{ N}$

Illustration 15:

Find the number of moles of KMnO_4 needed to oxidise one mole Cu_2S in acidic medium. The reaction is

**Solution :**

From law of equivalence

equivalents of Cu_2S = equivalents of KMnO_4

moles of $\text{Cu}_2\text{S} \times \text{v.f} = \text{moles of } \text{KMnO}_4 \times \text{v.f.}$

$$1 \times 8 = n_2 \times 5$$

$$n_2 = \frac{8}{5} = 1.6$$

Illustration 16:

Find the number of moles of oxalate ions oxidized by one mole of MnO_4^- ion in acidic medium.

$$(1) \frac{5}{2}$$

$$(2) \frac{2}{5}$$

$$(3) \frac{3}{5}$$

$$(4) \frac{5}{3}$$

Solution :

Equivalents of $\text{C}_2\text{O}_4^{2-} = \text{equivalents of } \text{MnO}_4^-$

$$x (\text{mole}) \times 2 = 1 \times 5 ; x = \frac{5}{2}$$

Illustration 17:

What volume of 6 M HCl and 2 M HCl should be mixed to get two litre of 3 M HCl?

Solution :

Let, the volume of 6 M HCl required to obtain 2 L of 3M HCl = x L

$\therefore$ Volume of 2 M HCl required = (2 - x) L

$$\begin{array}{ccccc} M_1V_1 & + & M_2V_2 & = & M_3V_3 \\ 6\text{M HCl} & & 2\text{M HCl} & & 3\text{M HCl} \end{array}$$

$$6 \times (x) + 2 \times (2 - x) = 3 \times 2$$

$$\Rightarrow 6x + 4 - 2x = 6 \Rightarrow 4x = 2$$

$$\therefore x = 0.5 \text{ L}$$

Hence, volume of 6 M HCl required = 0.5 L

Volume of 2M HCl required = 1.5 L

Illustration 18:

In a reaction vessel, 1.184 g of NaOH is required to be added for completing the reaction. How many millilitre of 0.15 M NaOH should be added for this requirement ?

Solution :

Amount of NaOH present in 1000 mL of 0.15 M NaOH = $0.15 \times 40 = 6 \text{ g}$

$$\therefore 1 \text{ mL of this solution contain NaOH} = 6 \times 10^{-3} \text{ g}$$

$$\therefore 1.184 \text{ g of NaOH will be present in} = \frac{1}{6 \times 10^{-3}} \times 1.184 = 197.33 \text{ mL}$$

Illustration 19:

What weight of Na_2CO_3 of 85% purity would be required to prepare 45.6 mL of 0.235N H_2SO_4 in any particular process ?

Solution :

$$\text{Meq. of Na}_2\text{CO}_3 = \text{Meq. of H}_2\text{SO}_4 = 45.6 \times 0.235$$

$$\therefore \frac{W_{\text{Na}_2\text{CO}_3}}{E_{\text{Na}_2\text{CO}_3}} \times 1000 = 45.6 \times 0.235$$

$$\Rightarrow \frac{W_{\text{Na}_2\text{CO}_3}}{106/2} \times 1000 = 45.6 \times 0.235$$

$$\therefore W_{\text{Na}_2\text{CO}_3} = 0.5679 \text{ g}$$

For 85 g of pure Na_2CO_3 , weight of sample = 100 g

$$\therefore \text{For } 0.5679 \text{ g of pure Na}_2\text{CO}_3, \text{ weight of sample} = \frac{100}{85} = 0.6681 \text{ g}$$

Illustration 20:

The number of moles of KMnO_4 that will be required to react with 2 mol of ferrous oxalate is

- (1) $\frac{6}{5}$ (2) $\frac{2}{5}$ (3) $\frac{4}{5}$ (4) 1

Solution :

3 moles of $\text{KMnO}_4 = 5$ moles of FeC_2O_4

$$\therefore 2 \text{ mol of ferrous oxalate} \equiv \frac{6}{5} \text{ mole of KMnO}_4$$

Hence, (A) is the correct answer.

Illustration 21:

What volume of 6 M HNO_3 is needed to oxidize 8 g of Fe^{2+} to Fe^{3+} , HNO_3 gets converted to NO?

- (1) 8 mL (2) 7.936 mL (3) 32 mL (4) 64 mL

Solution :

$$\text{Meq. of HNO}_3 = \text{Meq. of Fe}^{2+}$$

$$\text{or } 6 \times 3 \times V = \frac{8}{56} \times 1000$$

$$V = 7.936 \text{ mL}$$

valency factor = 3

Hence, (B) is the correct answer.

Illustration 22:

Which of the following is / are correct?

(1) g mole weight = molecular weight in g = wt. of 6.02×10^{23} molecules

(2) mole = N_A molecule = 6.02×10^{23} molecules

(3) mole = g molecules

(4) none of the above

Solution :

Ans. (1), (2) and (3)
